ALO66051.1 GI:4945019 ALO66051.1 GI:4945019 VERSION GSS. SOURCE CNGANISM Drosophila melanogaster ELAMOROS Fruit f1y, CNGANISM Drosophila melanogaster ELAMOROS Fromorpha; Ephydroidea; Drosophila. REFERENCE AUTHORS JOURNAL JOURNAL SUBMITTE JOURNAL	The BLOS is the constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Goosegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo. NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's Pl and EST library is now detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm. Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC ibrary was prepared by Kazutcyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2: cn bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruifily.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Gsoegawa and Aaron Mammeoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial Ecoral digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2: on bw sp. the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CNSOO6XK 935 bp DNA linear GSS 03-JUN-1999 Drosophila melanogaster genome survey sequence T7 end of BAC # BACR14N09 of RPCI-98 library from Drosophila melanogaster (fruit

- Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Cancer Genetics at the Roswell Park Cancer Constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; on bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             925 bp DNA linear GSS 03-JUN-1999 Drosophila melanogaster genome survey sequence TET3 end of BAC # BACK19116 of RPCI-98 library from Drosophila melanogaster (fruit AL053013

Determination of this BAC-end sequence was carried out as part of collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For futther information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Gooegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswall Park Cancer Institute in Buffalo,

NY. The library is named RPCI 98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; on bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://Dacpac.med.buffalo.edu/drosophila_bac.htm.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               / SIDS5/gcgdata/geneseq/geneseqpe emb1/A41999.DAT:*

                                                                                                                                                                                                                                                                            ö
                                                                  The present sequence is S. goldeniensis SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycelium in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents,

The present sequence is S. griseus SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycelium in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraine agents, herbicides, antiparasitic agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mycelium
                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 VHIAPADPETFGEVLIRLQVGSDQAMFRVGTAPLVAFLDRTDKIVPLGQERSLADFDALL 120

SsgA reduces branching and fragment septration and enhances fragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigralne agents, herbicides, antiparasitic agents,

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a

                                                                                                                    Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used a diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel receptor type protein tyrosine phosphatase beta protein used to modulate normal cellular processes of differentiation, metabolism, cell cycle by competing with endogenous transmembrane receptors for ligands
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; protein tyrosine phosphatase; PTPase; vulnerary; cytostatic; antlinflammatory; antidiabetic; viral infection; inflammation; cancer; receptor-type protein tyrosine phosphatase beta; RPTPbeta; carbonic anhydrase; CAH; diabetes mellitus.

receptor-type protein typosine in a signature of the protein typosine prospection of glycoprotein. The receptor and its ligands are useful for developing compounds and strategies for modifying cellular processes (e.g. normal cellular processes such as differentiation, metabolism, cell cycle control, wound healing and neuronal function, cellular behaviour such as motility, migration, and contact inhibition, in addition to abnormal or potentially deleterious processes such as virus-receptor interactions, inflammation, cellular transformation to a cancerous state, and the development of Type 2, insulin independent, diabetes mellitus, under the control of the receptor protein tyrosine phosphatases. The receptors of the receptor protein tyrosine phosphatases. The receptors of the receptor molecules for available ligands, thus reducing transmembrane receptor molecules for available ligands, thus reducing to ribibiting ligand binding to endogenous RPTPasses. RPTPasses and/or their ligands, may also be used to screen for additional molecules that can act to modulate the activity of cellular processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is

the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to down; acres infections. The antibodies may also be used a diagnostic agents for determining P. acnes proteins by acres proteins acres infections. The antibodies may also be used a diagnostic agents for determining P. acnes prosence, for example, by note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The invention relates to the isolation of genes AAC81710-C81758 encoding the human secreted proteins AAB45386-B5434. This sequence represents a fragment of the protein encoded by the gene given in the descriptor inc. The sequence is used as a query sequence for doing BLASTX searches to determine homologous sequence to the protein. The genes and proteins are susful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclenosis, rheumatoid arthritis and ulcerative colitis; (c) wound halling; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and infectious diseases such as wiral, bacterial, fungal and parasitic infectious diseases such as viral, bacterial, fungal and parasitic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   . . 4
New nucleic acid molecules encoding 49 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and

Sequences AA039105-AA068017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by content and acceptance of the treatment, prevention and diagnosis of medical conditions caused by purposes. The disorders include SAPHO syndrome (synovitis, acne, content and solve in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a cample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The colypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and cherefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by contact in the sequence data for this patent din not form part of the printed specification, but was obtained in electronic format directly from WIPO cat fip.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

sequences from the Coryneform bacterium Corynebacterium glutuamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, considerable assign amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium, coryneform bacterium coryneform bacterium or are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                     Novel polynucleotides derived from Coryneform bacteria, for identifying
                                                                                      mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Corynebacterium glutamicum; carbon metabolism and energy production; SMP protein; sugar metabolism and oxidative phosphorylation protein; fine chemical production; organic acid; proteinogenic amino acid; nonproteinogenic amino acid; purine base; pyrimidine base; nucleoside; nucleotied; lipid; saturated fatty acid; unsaturated fatty acid; diacusobyydrate; aromatic compound; vitamin; cofactor; polyketide; enzyme; diagnosis; Corynebacterium diphtheriae; evolutionary study.

                                                                                                                                                                           AAY81501 to AAY81679 represent specifically claimed protein sequences isolated from Streptococcus pneumoniae. AAA05407 to AAA05590 represent specifically claimed nucleotide sequences isolated from S. pneumoniae. The sequences have antibacterial and antilifiammatory properties. The protein sequences, and fragments of them, are useful as immunogens and/or antigens. The nucleotide sequences can be useful as immunogens and/or antigens. The proteins and nucleotides can be useful for the detection and diagnosis of S. pneumoniae. The protein sequences are also useful for screening an agent capable of antagonising, inhibiting or interfering with the function or expression of the proteins in which the agent is useful for treatment or prophylaxis of S. pneumoniae infection and meningitis. AAA05591 to AAA05614 represent primers used in the exemplification of the present invention.
                                                                     New Streptococcal protein, useful as a vaccine, for diagnosis of pneumococcal diseases and for screening agents capable of antagonizing or inhibiting expression of the protein

metabolism and oxidative prospectivation (SMP) proteins given in metabolism and oxidative prospectivation (SMP) proteins given in carbon metabolism and energy production. The C. glutamicum SMP gene can be used in vectors (II) for expression in host cells and production or modulation of production of fine chemicals, such as, an organic acid, a proteinogenic or nonproteinogenic amino acid (preferred), a purine or pyrimidine base, a nucleoside, a nucleotide, a lipid, a saturated or unsaturated fatty cofactor, a polyketide, or an enzyme. The presence of (I) or SMP proteins (III) encoded by them are used for diagnosing the presence or activity of corprehacterium diphtheriae in a subject. (I), (II), (III) or host cells containing them are used to map genomes of organisms related to c. glutamicum, identify and localise C. glutamicum sequences of interest, in evolutionary studies, in determining SMP protein regions required for function, in modulating SMP protein activity, in modulating the metabolism of sugars, and in modulating high-energy molecule production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated Corynebacterium glutamicum nucleic acid encoding a sugar metabolism and oxidative phosphorylation protein for production or modulation of production of fine chemicals e.g. amino acids, carbohydrates or enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAF71360 to AAF71750 encode the Corynebacterium glutamicum sugar

Patent No. 592536
GENERAL INFORMATION:
APPLICANT: Schlessinger, Joseph
TITLE OF INVENTION: A NOVEL RECEPTOR-TYPE PHOSPHOTYROSINE
TITLE OF INVENTION: PHOSPHATASE-BETA
NUMBER OF SEQUENCES: 9
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   33; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HUNDROUX BENDANCE BENDANCE BENDANCE BENDANCE FOR STABILITY OF THE PTSI RECEPTOR.

C -1- SUBCELLULAR LOCATION: CYLOPIASSMIC.

C -1- SUBCELLULAR LOCATION: CYLOPIASSMIC.

C -1- DISCASE BEFECTS IN PEXG ARE THE CAUSE OF PEROXISOME BIOGENESIS DISCASES: DEFECTS IN PEXG ARE THE CAUSE OF PEROXISOME BIOGENESIS.

C -1- DISCASE GROUP 4 (PBD GROUP 4). PBD ARE A GROUP OF LETHAL BIOGENESIS DISCASES. THEY ARE CLINICALLY DIVIDED INTO FOUR GROUPS: CELMEGER SYNDROME (2S), NEONATAL ADRENOLEUKODYSTROPHY (NALD), INFANTILE REFSUM DISCASE (TRD), AND CLASSICAL RHIZOMELIC CHONDRODYSPLASIA PUNCTATA (RCDP). ZS IS THE MOST SYVERE PHENOTYPE OF THE PBD AND IS CHARACTERIZED BY THE ABSENCE OF PEROXISOMES AND BY MULTIPLE METABOLIC DEFECTS: PATIENTS WITH ZS HAVE SEVERE NEUROLGICAL ABNORMALITIES, DYSMORPHIC FACIAL FEATURES, HERDALOMES, HERDALOMES, MOST IND THEN AND AND IRD ARE SIMILAR TO 2S, BUT PROGRESSIVELY MILDER, WITH SOME IRD PATIENTS SURVIVING BEYOND THE THIRD DECADE OF LIFF. CLASSICAL RCDP, DISTINCT FROM THE ZS SPECTRUM, IS ASSOCIATED WITH A CHARACTERISTIC FACIAL APPEARANCE, RHIZOMELIA, CHITANDELIA, AND SEVERE NEUROLGGICAL IMPAIRMENT.
